[CLIENT]: Acumatica / Asite Integration:

Summary:

[CLIENT] is using Acumatica as their ERP system to manage inventory, projects, purchase orders, and service orders. Asite is providing pre and post punch forms support which will be integrated via API to Acumatica. The trigger for Asite to create a punch list will be when an appointment is created in Acumatica. Items marked complete in Asite will be updated in Acumatica as complete at the appointment level. Acumatica will handle billing at the project and contractor level.

Process flow:

Below is the process flow that shows the creation of appointments in Acumatica, basic steps in Asite, and appointment completion. Requirements and expectations are outlined for each step in the process.

Step 1. Project is created in Acumatica.

The project is created in Acumatica by [CLIENT] staff. No action is needed by Asite.

Step 2. Acumatica System Auto Creates Appointment

Once the project is ready [CLIENT] will update the project to an active status. This will trigger the business event in Acumatica to create an appointment in the system. A separate appointment will be created based on cost code in the project. An example of the various cost codes are:

000	DEFAULT
100	Slab Plumbing
200	Rough
202	Rough Fixtures
300	Trim
302	Trim Fixtures
400	Water Line
500	Sewer Line
800	Warranty
900	Extra
901	Sub Backcharge
950	Service
999	General Conditions

The automatically generated appointments will be spaced out based on the cost codes for example slab will be 30 days, rough 60 days, and Trim 90 days. Project tasks will also be included in this as well. Project tasks will outline which will design which area of the project work is being completed. Many different project tasks could be included in an appointment and for a single cost code. Below is an example of these tasks:

ADD COMMON TASKS ACTIVATE TASKS COMPLETE TASKS

*Task ID	*Type	*Description	Rate Table
100	Cost and Revenue...	Slab	
200	Cost and Revenue...	Rough	
300	Cost and Revenue...	Trim	
BSMNT	Cost and Revenue...	BASEMENT	
GB1	Cost and Revenue...	GUEST BATH 1	
GB2	Cost and Revenue...	GUEST BATH 2	
GB3	Cost and Revenue...	GUEST BATH 3	
GB4	Cost and Revenue...	GUEST BATH 4	
GB5	Cost and Revenue...	GUEST BATH 5	
HB	Cost and Revenue...	HOSE BIBBS	
KITCH	Cost and Revenue...	KITCHEN	
LAUND	Cost and Revenue...	LAUNDRY ROOM	
MB	Cost and Revenue...	Master Bath - Level 1	
MB2	Cost and Revenue...	Master Bath - Level 2	
MBLVL1	Cost and Revenue...	Primary Bath - Level 1	

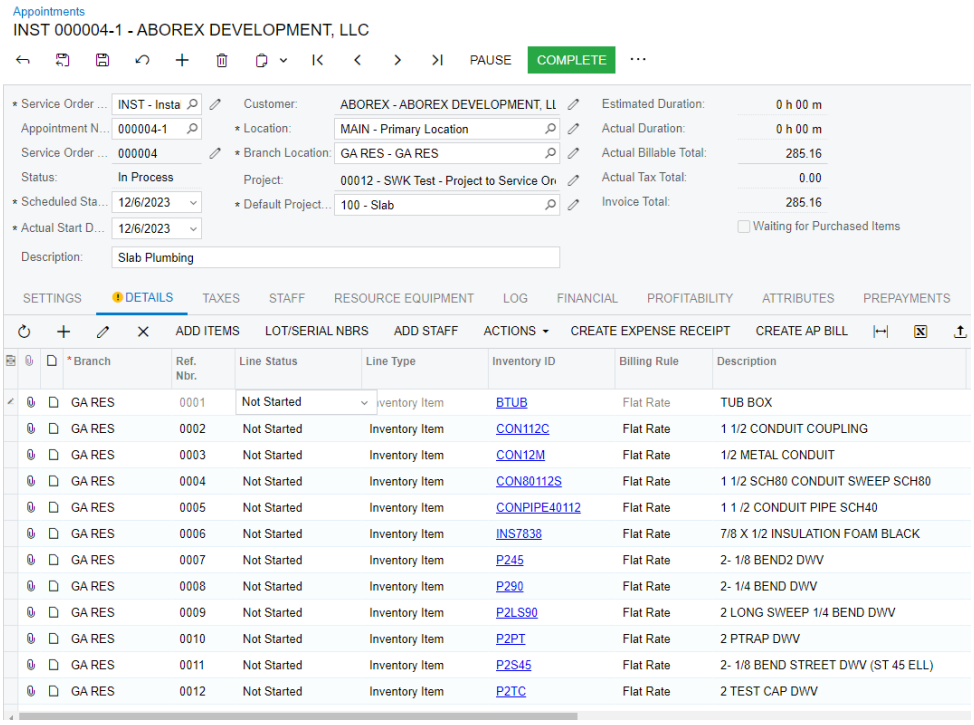

Step 3. Use the creation of the appointment status trigger to create Asite Form

Once an appointment is created it is ready to be created in Asite. This appointment will include the following information that needs to be included:

- Service Order (FSAppointment.SORefNbr)
- Appointment Number (FSAppointment.RefNbr)
- Customer (FSAppointment.CustomerID)
- Project (FSAppointment.ProjectID)
- Scheduled Start Date (FSAppointment.ScheduledDateTimeBegin_Date)
- Description (FSAppointment.DocDesc)
- Address:
    - Address 1 (FSAddress.AddressLine1)
    - Address 2 (FSAddress.AddressLine2)
    - City (FSAddress.City)
    - State (FSAddress.State)
    - Postal Code (FSAddress.PostalCode)
- Details (Items) (FSAppointmentDet)
    - Line Status (FSAppointmentDet.UIStatus)
    - Inventory ID (FSAppointmentDet.InventoryID)
    - Description (FSAppointmentDet.TranDesc)
    - Unit of Measure (FSAppointmentDet.UOM)
    - Estimated Quantity (FSAppointmentDet.EstimatedQty)
    - Project Task (FSAppointmentDet.ProjectTaskID)
- Staff (Contractor) – (FSAppointmentEmployee.EmployeeID)

Line status doesn't need to be pulled over however later in process it will need to be updated to mark items as complete.

Below is a screen shot of an example appointment:

Step 4. Pre-Punch form is automatically created in Asite.

See step 3.

Step 5. The appointment is assigned to a subcontractor in Acumatica and or date is updated.

In Acumatica the date could be changed as schedules are aligned and the appointment is becomes closer to the actual date of completion. A subcontractor will also be assigned. When either is updated in Acumatica, Asite will need to update them as well on their end.

- Scheduled Start Date (FSAppointment.ScheduledDateTimeBegin_Date)
    - This will be the date used for the scheduled date in Acumatica
- Staff (Contractor) – (FSAppointmentEmployee.EmployeeID)
    - While the descriptor and field names relate to internal staff or an employee, this field in this case refers to the vendor or subcontractor setup in Acumatica.

Step 6. Pre-Punch form is updated in Asite with contractor and or date.

See step 5 above.

Step 7. PM prints the form and hands it to the sub

This is an internal process with [CLIENT]. They use this to communicate with their subcontractors.

Step 8. [CLIENT] inputs the information on the post punch form

Users on the [CLIENT] side will update Asite during their walkthrough, marking items as complete.

Step 9. Appointment tasks are updated and incident reports, pictures and completed forms are attached to the appointment.

When items are marked complete in Asite they will need to be updated on Acumatica's side in the appointment. Items that are not completed can stay as is meaning the status do not need to be updated. Acumatica settings have them set to remain not completed by default. The two fields will need to be updated are:

- Line Status (FSAppointmentDet.UIStatus)
    - This is what is used to mark items as complete. The status of "Completed" should be used.
- Actual Qty (FSAppointmentDet.ActualQty)
    - This is the number of items used. Only items that are marked "Completed" should be marked this way. Items not marked complete should not be updated.

In addition to the items above being updated the following should be included as an attachment:

- Incident report
- Pictures
- Completed forms

These items will be attached to the top level of the appointment. Acumatica offers the ability to attach items at a line via the web interface. In this case we only need to attach these at the appointment level.

Step 10. Appointment is marked complete

Once the update is complete from Asite, this will trigger a business event to complete the appointment in Acumatica. No action is needed by Asite.

Step 11. Change order for items not completed

There is no support via API to trigger creating a change order. Currently no action is needed on this from Asite.

Step 12. Project billing / AP Bill

During the normal process in Acumatica project and AP billing will occur.
